0.1.1 Chapter 1 - Udacity Final Project

This directory contain all code that was used for the Udacity Data Scientist Nanodegree Program

0.1.2 Chapter 2 - Step 1: Define the Problem

For this project, the problem statement is given to us, develop an algorithm to predict the default of home credit.

Project Summary: Many people struggle to get loans due to insufficient or non-existent credit histories. And, unfortunately, this population is often taken advantage of by untrustworthy lenders.

In this project, we ask you to complete the analysis of which customers of home credit were likely default. In particular, we ask you to apply the tools of machine learning to predict which customers defaulted.

Project Metrics: Default customer can be predicted using less variable at credit risk perspective. So selected model specification must be explainable and applicable.

Practice Skills

- Binary classification
- Python

0.1.3 Chapter 3 - Step 2: Gather the Data

The dataset is given to us as test and train data at Kaggle's Home Credit Default Risk

3.1 Import Libraries The following code is written in Python 3.x. Libraries provide pre-written functionality to perform necessary tasks.

```
In [1]: #load packages
    import pandas as pd
    import numpy as np
    import seaborn as sns
    import matplotlib.pyplot as plt
    %matplotlib inline
    import random as rnd
```

3.11 Load Data Modelling Libraries We will use the popular scikit-learn library to develop our machine learning algorithms and for data visualization, we will use the matplotlib and seaborn library. Below are common classes to load.

```
In [2]: #Common Model Algorithms
```

```
from sklearn.linear_model import LogisticRegression from sklearn.preprocessing import LabelEncoder from sklearn.neighbors import KNeighborsClassifier from sklearn.svm import SVC,LinearSVC from sklearn.ensemble import RandomForestClassifier from sklearn.naive_bayes import GaussianNB from sklearn.linear_model import Perceptron from sklearn.linear_model import SGDClassifier from sklearn.tree import DecisionTreeClassifier #Visualization import matplotlib as mpl import matplotlib.pyplot as plt import matplotlib.pylab as pylab import seaborn as sns
```

0.1.4 Chapter 4 - Step 3: Prepare the Data

To begin this step, The data is imported firstly. Next we use the info() and head() function, to get a quick and dirty overview of variable datatypes (i.e. qualitative vs quantitative). Click here for the Source Data Dictionary.

```
In [3]: train_df = pd.read_csv("application_train.csv")
    test_df = pd.read_csv("application_test.csv")
    #bureau_df = pd.read_csv("bureau.csv")
    #bureau_balance_df = pd.read_csv("bureau_balance.csv")
    #credit_card_balance_df = pd.read_csv("credit_card_balance.csv")
    #HomeCredit_columns_description_df=pd.read_csv("HomeCredit_columns_description.csv")
```

```
#installments_payments_df=pd.read_csv("installments_payments.csv")
         #POS_CASH_balance_df=pd.read_csv("POS_CASH_balance.csv")
         #previous_application_df=pd.read_csv("previous_application.csv")
         \#sample\_submission\_df=pd.read\_csv("sample\_submission.csv")
In [4]: pd.set_option('display.max_rows', 500)
        pd.set_option('display.max_columns', 500)
        pd.set_option('display.width', 1000)
In [5]: # train_df
        # preview the data
        train_df.head(10)

What is the distribution of categorical features?

- Contract type as two possible values with 90% Cash loans (top=Cash loans, freq=278232/count=307511).
- Gender variable as three possible values with 66% female (top=female, freq=202448/count=307511).
- Own Car variable two possible values with 66% "No" (top=N,freq=202924/count=307511).
- Own Realty variable as two possible values with 69% "Yes" (top=Y, freq=213312/count=307511).
- possible values Suite Type variable as seven with 81% unaccompanied (top=Unaccompanied, freq=248526/count=306219).

- Income Type variable as eight possible values with 81% Working (top=Working, freq=248526/count=307511).
- Education Type variable as five possible values with 71% unaccompanied (top=Secondary / secondary special, freq=218391/count=307511).
- Family status variable as six possible values with 64% "Married" (top=Married, freq=196432/count=307511).
- Housing type variable as six possible values with 89% "House / apartment " (top=House / apartment, freq=272868/count=307511).
- Occupation type variable as eighteen possible values with 26% "Laborers" (top=Laborers, freq=55186/count=211120).
- Weekday aproval process start day variable as seven possible values with 18% "TUESDAY" (top=TUESDAY, freq=53901/count=307511).
- Organization type variable as fifty eight possible values with 22% "Business Entity Type 3" (top=Business Entity Type 3, freq=67992/count=307511).
- Fondkapremont mode variable as four possible values with 76% "reg oper account" (top=reg oper account, freq=73830/count=97216).
- House type variable as three possible values with 98% "block of flats" (top=block of flats, freq=150503/count=153214).
- Walls material variable as seven possible values with 44% "Panel" (top=No, freq=66040/count=151170).
- Emergency state variable as two possible values with 99% "No" (top=No, freq=159428/count=161756).

0.1.5 Chapter 5 - The 4 C's of Data Cleaning: Correcting, Completing, Creating, and Converting

5714470

5714471

In this stage, data should have been cleaned 1. Correcting abnormal values and outliers 2. Completing missing information 3. Creating new features for analysis 4. Converting fields to the correct format for calculations and presentation.

Correcting: Reviewing the data, there should have been analyzed to be any abnormal or non-acceptable data inputs. In addition, age and income may have outlier values. Exploratory analysis

will done to find reasonable values. Outliers should been elimated in dataset. It should be noted, that if unreasonable values were, for example age is 1000 then it also should be elimaneted.

Completing: There are null values or missing data in dataset. Missing values can be bad, because some algorithms don't know how-to handle null values and will fail. While others, like decision trees, can handle null values. Thus, it's important to fix before modeling will started because several models will have compared. There are two common methods, either delete the record or populate the missing value using a reasonable input. It is not recommended to delete the record, especially a large percentage of records, unless it truly represents an incomplete record. Instead, it's best to impute missing values. A basic methodology for qualitative data is impute using mode. A basic methodology for quantitative data is impute using mean, median, or mean + randomized standard deviation.

Creating: Feature engineering is when we use existing features to create new features to determine if they provide new signals to predict our outcome.

Converting: Last, but certainly not least, we'll deal with formatting. There are no date or currency formats, but datatype formats. Our categorical data imported as objects, which makes it difficult for mathematical calculations. For this dataset, we will convert object datatypes to categorical dummy variables

0.1.6 5.1 Correcting

min

We have been analyzed for dataset. We have seen the maximum count of childred variable. So maximum age is 19. Outlier have elimated for count of children=19.

We have not seen any anormaly dataset. We check this step for dataset

0.1.7 5.2 Completing

We can analyze the missing value. But some data can not completed for missing value. Because some values normally is missingç For example customers who have no credit bureau information and related coloumns have no information about customer. We can filter variable of occupation_type because of 96391 missing value.

0.2 Chapter 6 - Step 4: Perform Exploratory Analysis with Statistics

0.2.1 6.1 Correlation Elimination

All variable analyze the correlation of target. We will choose higher than 0.05 or lower than -0.005. Correlations are very useful in many applications, especially when conducting regression analysis. However, it should not be mixed with causality and misinterpreted in any way. I should also always check the correlation between different variables in our dataset and gather some insights as part of my exploration and analysis.

```
In [66]: #correlation heatmap of dataset
         def correlation_heatmap(df):
             _ , ax = plt.subplots(figsize =(14, 12))
             colormap = sns.diverging_palette(220, 10, as_cmap = True)
             _ = sns.heatmap(
                 df.corr(),
                 cmap = colormap,
                 square=True,
                 cbar_kws={'shrink':.9 },
                 ax=ax,
                 annot=True,
                 linewidths=0.1,vmax=1.0, linecolor='white',
                 annot kws={'fontsize':12 }
             )
             plt.title('Pearson Correlation of Features', y=1.05, size=15)

0.3 6.2 Train Test Cross Validation Split

the data we use is usually split into training data and test data. The training set contains a known output and the model learns on this data in order to be generalized to other data later on. We have the test dataset (or subset) in order to test our model's prediction on this subset. In order to avoid this, we can perform something called cross validation. It's very similar to train/test split, but it's applied to more subsets. I decided to split size in below side

- Train dataset %60
- Test dataset %20
- Cross Validation dataset %20

1 7. Model Data

1.1 7.1 Modelling selection

In literature logistic regression have been used for credit risk modeling. So I selected logistic regression modelling approach.

References: https://smartdrill.com/pdf/Credit%20Risk%20Analysis.pdf

1.2 7.2 Model Implementation

```
In [87]: #Model Alternative 1

X=train_df_final_list_V2
y = train_df['TARGET']

X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state)

X_train, X_val, y_train, y_val = train_test_split(X_train, y_train, test_size=0.25, random_state)

#X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.95, random_state)

# check classification scores of logistic regression
logreg = LogisticRegression()
logreg.fit(X_train, y_train)
```

y_pred_proba = logreg.predict_proba(X_test)[:, 1]

y_pred = logreg.predict(X_test)

```
[fpr, tpr, thr] = roc_curve(y_test, y_pred_proba)
        print('Train/Test split results:')
        print(logreg.__class__.__name__+" accuracy is %2.3f" % accuracy_score(y_test, y_pred)
        print(logreg.__class__.__name__+" log_loss is %2.3f" % log_loss(y_test, y_pred_proba)
        print(logreg.__class__.__name__+" auc is %2.3f" % auc(fpr, tpr))
         idx = np.min(np.where(tpr > 0.95)) # index of the first threshold for which the sensi
        plt.figure()
        plt.plot(fpr, tpr, color='coral', label='ROC curve (area = %0.3f)' % auc(fpr, tpr))
        plt.plot([0, 1], [0, 1], 'k--')
        plt.plot([0,fpr[idx]], [tpr[idx],tpr[idx]], 'k--', color='blue')
        plt.plot([fpr[idx],fpr[idx]], [0,tpr[idx]], 'k--', color='blue')
        plt.xlim([0.0, 1.0])
        plt.ylim([0.0, 1.05])
        plt.xlabel('False Positive Rate (1 - specificity)', fontsize=14)
        plt.ylabel('True Positive Rate (recall)', fontsize=14)
        plt.title('Receiver operating characteristic (ROC) curve')
        plt.legend(loc="lower right")
        plt.show()
        print("Using a threshold of %.3f " % thr[idx] + "guarantees a sensitivity of %.3f " %
               "and a specificity of %.3f" % (1-fpr[idx]) +
               ", i.e. a false positive rate of %.2f%%." % (np.array(fpr[idx])*100))
Train/Test split results:
LogisticRegression accuracy is 0.920
LogisticRegression log_loss is 0.271
```

LogisticRegression auc is 0.626

Using a threshold of 0.043 guarantees a sensitivity of 0.950 and a specificity of 0.109, i.e.

```
In [88]: #Model Alternative 1
         #Cross Validation
         # check classification scores of logistic regression
        logreg = LogisticRegression()
        logreg.fit(X_train, y_train)
        y_pred = logreg.predict(X_val)
        y_pred_proba = logreg.predict_proba(X_val)[:, 1]
         [fpr, tpr, thr] = roc_curve(y_val, y_pred_proba)
        print('Train/Test split results:')
        print(logreg.__class__.__name__+" accuracy is %2.3f" % accuracy_score(y_val, y_pred))
        print(logreg.__class__.__name__+" log_loss is %2.3f" % log_loss(y_val, y_pred_proba))
        print(logreg.__class__.__name__+" auc is %2.3f" % auc(fpr, tpr))
        idx = np.min(np.where(tpr > 0.95)) # index of the first threshold for which the sensi
        plt.figure()
        plt.plot(fpr, tpr, color='coral', label='ROC curve (area = %0.3f)' % auc(fpr, tpr))
        plt.plot([0, 1], [0, 1], 'k--')
```

```
plt.plot([0,fpr[idx]], [tpr[idx],tpr[idx]], 'k--', color='blue')
         plt.plot([fpr[idx],fpr[idx]], [0,tpr[idx]], 'k--', color='blue')
         plt.xlim([0.0, 1.0])
         plt.ylim([0.0, 1.05])
         plt.xlabel('False Positive Rate (1 - specificity)', fontsize=14)
         plt.ylabel('True Positive Rate (recall)', fontsize=14)
        plt.title('Receiver operating characteristic (ROC) curve')
         plt.legend(loc="lower right")
         plt.show()
        print("Using a threshold of \%.3f " \% thr[idx] + "guarantees a sensitivity of \%.3f " \%
               "and a specificity of %.3f" % (1-fpr[idx]) +
               ", i.e. a false positive rate of %.2f%%." % (np.array(fpr[idx])*100))
Train/Test split results:
```

LogisticRegression accuracy is 0.919 LogisticRegression log_loss is 0.274 LogisticRegression auc is 0.621

Using a threshold of 0.042 guarantees a sensitivity of 0.950 and a specificity of 0.092, i.e.

The variable is selected that least correlation of target. After that the variable will be eliminated in model. If the Auc value is not decreasing too much, the variable will be eliminated

```
In [89]: #Model Alternative 2
         X=train_df_final_list_V3
         y = train_df['TARGET']

               "and a specificity of %.3f" % (1-fpr[idx]) +
               ", i.e. a false positive rate of %.2f%%." % (np.array(fpr[idx])*100))
```

```
Train/Test split results:
LogisticRegression accuracy is 0.920
LogisticRegression log_loss is 0.273
LogisticRegression auc is 0.608
```

Using a threshold of 0.047 guarantees a sensitivity of 0.950 and a specificity of 0.106, i.e. ϵ

```
In [90]: #Model Alternative 2
    #Cross Validation
    # check classification scores of logistic regression
    logreg = LogisticRegression()
    logreg.fit(X_train, y_train)
    y_pred = logreg.predict(X_val)
    y_pred_proba = logreg.predict_proba(X_val)[:, 1]
    [fpr, tpr, thr] = roc_curve(y_val, y_pred_proba)
    print('Train/Test split results:')
    print(logreg.__class__.__name__+" accuracy is %2.3f" % accuracy_score(y_val, y_pred))
    print(logreg.__class__.__name__+" log_loss is %2.3f" % log_loss(y_val, y_pred_proba))
    print(logreg.__class__.__name__+" auc is %2.3f" % auc(fpr, tpr))
```

```
idx = np.min(np.where(tpr > 0.95)) # index of the first threshold for which the sensi
         plt.figure()
         plt.plot(fpr, tpr, color='coral', label='ROC curve (area = %0.3f)' % auc(fpr, tpr))
         plt.plot([0, 1], [0, 1], 'k--')
         plt.plot([0,fpr[idx]], [tpr[idx],tpr[idx]], 'k--', color='blue')
         plt.plot([fpr[idx],fpr[idx]], [0,tpr[idx]], 'k--', color='blue')
         plt.xlim([0.0, 1.0])
         plt.ylim([0.0, 1.05])
         plt.xlabel('False Positive Rate (1 - specificity)', fontsize=14)
         plt.ylabel('True Positive Rate (recall)', fontsize=14)
         plt.title('Receiver operating characteristic (ROC) curve')
         plt.legend(loc="lower right")
         plt.show()
         print("Using a threshold of \%.3f " \% thr[idx] + "guarantees a sensitivity of \%.3f " \%
               "and a specificity of \%.3f" \% (1-fpr[idx]) +
               ", i.e. a false positive rate of %.2f%%." % (np.array(fpr[idx])*100))
Train/Test split results:
LogisticRegression accuracy is 0.919
LogisticRegression log_loss is 0.276
LogisticRegression auc is 0.609
```

Using a threshold of 0.047 guarantees a sensitivity of 0.950 and a specificity of 0.101, i.e.

1.2.1 7.3 Model Refinement

Model alternative 2 is better than first model. Beucause of Cross Validation AUC value is higer than train dataset. In addition to between Model alternative 1 and Model alternative 2 Auc is similar so I choose the Model Alternative 2

1.2.2 7.4 Model Result

We selected Model alternative 2 * Model Auc is 0.609 * Model Accuray is 0.920 Model variables are * AGE_CAL * CODE_GENDER_F * DAYS_LAST_PHONE_CHANGE

1.2.3 7.5 Model Implementation for Test dataset

We will implement the test data set

See the caveats in the documentation: http://pandas.pydata.org/pandas-docs/stable/user_guide/i

```
Out[93]: SK_ID_CURR TARGET

0 100001 0.048173

1 100005 0.101670

2 100013 0.076617

3 100028 0.065348

4 100038 0.115715
```

1.3 8 Conclusion

My expectation would be credit type, credit amount or income type for final variable modelling. But these variable were eliminated correlation step. I am surprised for this happen. This proeject aimed to end to end data processing and data modelling in credit risk data. I enjoyed to analyze and create this project

1.4 8.1 Improvement

Gradient Boosting method is more higher creating auc value than logistic regression in literature. For example, Data Scienctist have used Graditent Boosting and reached better than logistic regression results. https://www.kaggle.com/ashishpatel26/home-credit-default-analysis, Model detail contains in this link https://lightgbm.readthedocs.io/en/latest/
